

## Specifications

# Lithium Ion Rechargeable Cell

### High Energy Cylindrical Cell

Cell Type: LIR18650F-2200mAh

Prepared by:

Checked by:

Approved by:

Publication date:		Effective date:
2008/02/25		2008/02/25

## 5. Standard conditions for test

All the tests need to be done within one month after the delivery date under the following conditions :  
Ambient Temperature:  $25 \pm 5^{\circ}\text{C}$ ; Relative Humidity:  $65 \pm 20\%$

5.2. Standard Charge	Constant Current and Constant Voltage (CC/CV) Current = 1.1A Final charge voltage = 4.2V Final charge Current = 0.044A
5.3. Standard Discharge	Constant Current (CC) Current = 1.1A End Voltage = 3.0V

## 6. Appearance

All surfaces must be clean, without damages, leakage and corrosion. Each product will have a product label identifying the model.

## 8.Characteristics

In this section, the Standard Conditions of Tests are used as described in part 6.

### 8.1 Electrical Performances

Items	Test procedure	Requirements
8.1.1 Nominal Voltage	The average value of the working voltage during the whole discharge process.	3.7V
8.1.2 Discharge Performance	The discharge capacity of the cell, measured with 2.2 A down to 3.0V within 1 hour after a completed charge.	$\geq 57\text{min}$
8.1.3 Capacity Retention	After 28 days storage at $25 \pm 5^{\circ}\text{C}$ , after having been completely charged and discharged at 0.44A, discharge to 3.0V, the residual capacity is above 90%	Capacity $\geq 1980\text{mAh}$
8.1.4 Cycle Life	After 300 cycles at 100% DOD. Charge and discharge at 1.1A, the residual discharge capacity is above 80% of nominal capacity.	$\geq 300$ cycles
8.1.5 Storage	(Within 3 months after manufactured) The cells is charged with 1.1A to 40-50% capacity and stored at ambient temperature $25 \pm 5^{\circ}\text{C}$ , $65 \pm 20\% \text{RH}$ for 12 months. After the 12 months storage period the cell is fully charged and discharged to 3.0V with 0.44A	Discharge time $\geq 4\text{h}$

### 8.2 Safety Performances

Items	Test procedure	Requirements
8.2.1 Short Circuit	The cell is to be short-circuited by connecting the positive and negative terminals of the cell directly with copper wire with a resistance of less than $0.05\Omega$ .	No fire, no explosion.
8.2.2 Impact Test	The cell, placed on hard surface, receives impact from a hammer of 10Kg in free fall from 1m height.	No fire, no explosion.
8.2.3 Overcharge (3C/10V)	The cell is connected with a thermocouple and put in a fume hood. The positive and negative terminals are connected to a DC power supply set at 6.6A and 10V until the cell reaches 10V and the current drops to approximately 0A. Monitor the temperature of cell. When the temperature of the cell is approximately $10^{\circ}\text{C}$ less than the peak value, the test is completed.	No fire, no explosion.
8.2.4 Thermal shock	After standard charging, heat the cell to $150 \pm 2^{\circ}\text{C}$ at a rate of $5 \pm 2^{\circ}\text{C} / \text{min}$ and keep it at this temperature during 10 minutes.	No fire, no explosion.

### 8.3 Environmental tests

Items	Test procedure	Requirements
8.2.5 High temperature performance	The fully charged cell is put at 55±2°C for 2 hours and then discharged to 3.0V at 2.2A.	Capacity≥1870mAh
8.2.6 Low temperature performance	The fully charged cell is placed during 16-24 hours at -20±2°C and then discharge to 3.0V at 0.44A.	Capacity≥1540mAh
8.2.7 Anti-vibration	The fully charged cell is fixed on a platform and vibrated in the X , Y and Z directions for 30minutes at the speed 10ct/min Frequency: 10~30Hz, Vibration amplitude 0.38mm. Frequency: 30~55Hz, Vibration amplitude 0.19mm.	No deformation should be visible. Not leak, smoke and/or explode. Voltage should be not less than 3.6V.
8.2.8 Drop Test	The fully charged cell is dropped from a height of 1m onto a 15~20mm hard board in X, Y and Z directions once for all axis. Then the cell is discharged at 2.2A to 3.0V followed by 3 or more cycles with the standard charge rate and a discharge at 2.2A.	No fire, no explosion. Discharge Time≥57min

### 9 . Packing

Cells are at a half-charged state when packed. The packing box surface will contain the following: name, type, nominal voltage, quantity, gross weight, date, capacity and impedance.

### 10 . Transportation

During transport, do not subject the cell(s) or the box (es) to violent shaking, bumps, rain and direct sunlight. Keep the cell(s) at a half-charged state.

### 11 . Storage

Please keep the cell(s) in the cool and dry environment.

Allowable temperature range during storage:

- over a period of 1 month: -5 ~ 35°C, relative humidity: ≤75%.
- over a period of 6 months: 0 ~ 35°C, relative humidity: ≤75%.

Keep the cell(s) at a half-charged state.

### 12 . Warranty

12.1 The warranty period of this product is 6 months starting at the date of delivery from the factory.

12.2 Warranty will be void if the cells are used outside these specifications.

12.3 CHAM will not be liable for any damages, personal, material, immaterial or otherwise, when the cells are used outside these specifications.

### 13 . Changes of specifications

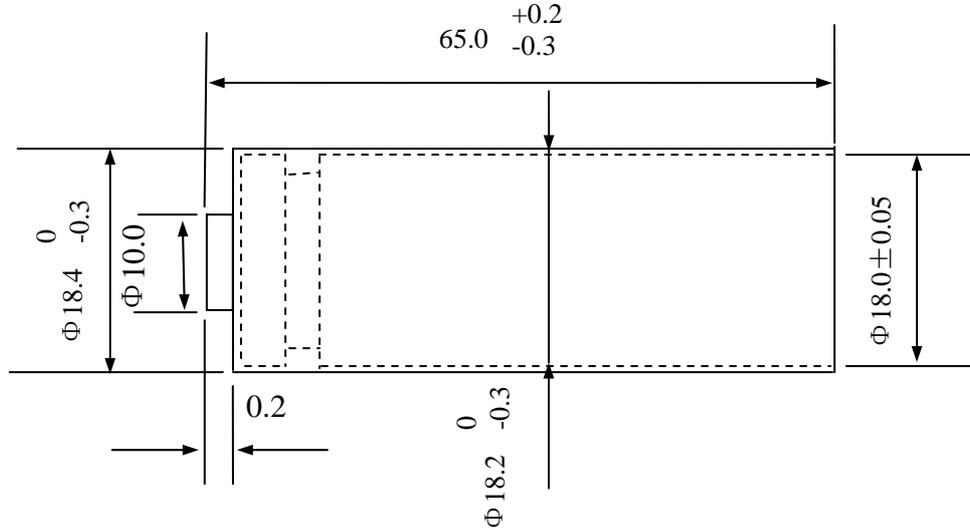

The information in this specification is subject to change without prior notice.

### 14 . For reference only

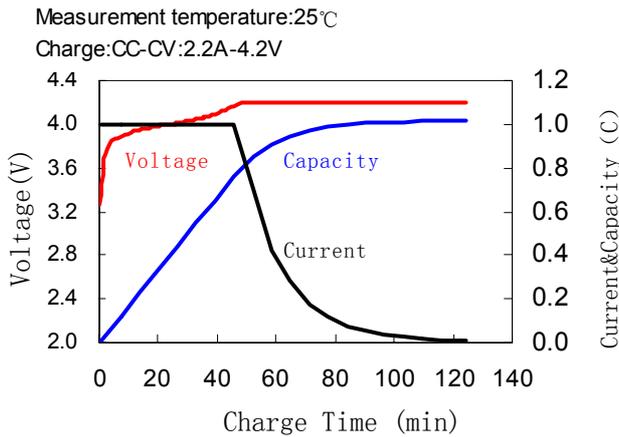

The information contained in this document is for reference only and should not be used as a basis for product guarantee or warranty. For applications other than those described here, please consult your nearest CHAM Sales Office or Distributors.
